The interior became more spacious due to the increase in the wheelbase to 2775 mm plus 55 mm. The glazing area was reduced by raising the lower edge of the doors. On the review from the cabin, these changes are not affected. All Camry are equipped with a standard display which can be displayed by reading the outside temperature, power reserve before refueling, average speed, average fuel consumption, distance from the beginning of the trip. Gasoline 4cylinder engine, 2.4 liters modified, changing the cylinder head and exhaust system. In the maximum configuration this engine is aggregated with a sixspeed automatic transmission. Twostage front cushions, side and curtains provide protection over the entire length of the cabin. Camry is equipped with a safety steering column. Protection of the head is ensured by energyabsorbing materials. Seats provide protection against whiplash injuries to the spine and head. Well assume youre ok with this, but you can optout if you wish. We've checked the years that the manuals cover You'll then be shown the first 10 pages of this specific. See Owners Warranty and Maintenance Guide for details. Starting with the 2020 model year, every Toyota hybrid battery warranty is being increased from 8 years or 100,000 miles, to 10 years from date of first use, or 150,000 miles whichever comes first. This enhancement serves as an indication of our confidence in the quality, dependability, and reliability of our products. The HV battery may have longer coverage under emissions warranty. For Toyota hybrid vehicles beginning with model year 2020, the hybrid HV battery is covered for 10 years from original date of first use or 150,000 miles, whichever comes first. Coverage is subject to the terms and conditions of your New Vehicle Limited Warranty.

<http://artcustomdrums.com/images/brother-dcp-130c-service-manual.pdf>

See Owners Warranty and Maintenance Guide for details. Most have 12month coverage, and there arent many, if any, companies that offer a longer guarantee. Car covers are warranted for 12 months from the date of purchase and do not assume any coverage under the Toyota New Vehicle Limited Warranty. So we thought the TCUV Warranty should be just as thorough. The HV battery may have longer coverage under emissions warranty. We also add a 1year 24hour Roadside Assistance Plan 4 from original date of TCUV purchase. For the enhanced peace of mind of an available Extended Vehicle Service Agreement, please visit Toyota Financial Services. From audio to optional No need to hunt down a Detailed Toyota manuals and Plus, learn more about Whats more, Toyota Select your Toyota model to. These machines are rightfully considered to be classic, and while their production is actively continuing, the Japanese manufacturer does not stop at the success achieved. Often, professionals and interested drivers will need a highquality reference book that would be available and clearly provide accurate answers to all questions related to the use, maintenance and repair of the car, as well as additional information useful to the user in the garage or on the road. Such a Toyota Camry repair manual exists, and from the most competent publisher. The proposed manual pays attention to these models of cars that are equipped with power units for gasoline 1AZFE 2.0 liters, 2ARFE 2.5 liters, 2GRFE 3.5 liters. See also Toyota engine repair manuals The content is structured in a logical and convenient way to quickly find the desired topic, and the drawings and diagrams will help to understand the main text and successfully apply the new information in practice. A detailed Toyota Camry instruction manual with diagrams and diagrams is presented, so that even a novice driver will be able to use his beloved car with the maximum benefit for himself without performing rash actions that could damage the vehicle.

In order to properly perform preventive procedures as part of Toyota Camry maintenance, you just need to refer to the appropriate section of the manual. A catalog of consumable parts is also given,

with which you can more easily orient yourself and you will not go wrong if you need to replace parts. Using the reference book, the master or driver will perform a series of correct actions, determining the nature of the breakdown, and then will be able to gradually eliminate the problem that has arisen using the most optimal course of action. The editors will have a look at it as soon as possible. Toyota replaced the compact V20 Camry with the Japanese marketonly V30 series in 1990. However, int. View More Info Includes guides to basically all aspects of the vehicle including servicing, repairs, rebuild information, wiring diagrams and diagnostics.

However, international markets such as Australia and North America received a widened version of the V30, known as the XV10 series. While marginally larger than the V20, the V30 had to comply with Japanese tax legislation which restricted the cars width to 1,700 millimetres 67 in and length to 4,700 millimetres 190 in. Particularly in the United States, this narrower model was seen as compromised, thus limiting its sales potential. The XV10, at its most basic level, offered a 2.2liter 5SFE fourcylinder engine, up from 2.0 liters in the V20 and V30 Camrys. An allnew aluminium 1MZFE V6 debuted in North American models from 1994, with other markets retaining the 3VZFE V6.A common problem for owners of the 3VZFE V6 Camry is mainly due to their knowledge of older conventional cooling systems, the location of the thermostat on this Camry is different to many older

cars. As with basically all cars, you can follow the main radiator hose to find the thermostat housing, however being a sideways mounted engine and most people being used to finding the thermostat on the actual intake manifold means they can become confused, as they believe the location where the water hose leads to must be wrong. Ill explain below where to find the thermostat and how to replace it. Before you begin, make sure you go to an automotive shop and purchase a brand new replacement thermostat, ensure this also comes with a round rubber ring which is the seal you will need to replace at the same time, reusing an old seal, forgetting to install the seal and ignoring the seal and using liquid silicone will result in serious leakage of the cooling system and could overheat and damage your engine, always use a brand new seal each time for these cars.

Another important thing to remember is that the rubber water hoses used for the radiator to transfer water are actually a consumable part, they should not be reused and each time they are removed they should be replaced with brand new hoses, these will be available from your local automotive parts supplier. Remember to get new round hose clamps to replace the old ones, the same automotive store will sell these. As the rubber hoses are connected to metal fittings, these metal fittings can build a lot of temperature and as such seal the hose onto the outlet, this is why you can have trouble removing them sometimes as they have fused onto the metal, they usually have also taken the shape of the water outlet, so breaking the seal that has formed can damage the hose. Replacing them with new water hoses does not cost much money and will lower the chance of cooling problems following the cooling system repairs. Now get some gloves rubber dishwashing gloves are usually handy and firstly ensure the cars water system is cool, if you have driven the car within the last 2 hours, let it sit until the 2 hour mark has passed, following this, use a thick rag to remove the radiator cap do this slowly just in case the system is still pressurised and the water is still in the warm hot range. If water begins to leak while you are removing the cap, tighten it again quickly, drop the rag and remove yourself away from the radiator source, if the cap has already released and you believe it cant be tightened, then drop the rag and move away to let the pressure vent. The system operates at around 180F degrees 82c, the normal temperature to cause rapid skin burns is 150F 65c and above. For this reason if it is a warm day even after 2 hours the water may still be this temperature. Once the cap is off, quickly test the temperature of the water, a thermometer is best for this. Now this is done, you can locate the thermostat.

The thermostat location on these cars is actually mounted to the water pump assembly. The water pump is located at the lower front of the engine, towards the inlet side, it is not mounted on or even near the actual intake manifold like most people would expect. Look to the lower left of the engine front and you will see the water pump assembly. If you are still having trouble, remember the water pump is actually extremely low, only just above the engine oil sump. You will notice the alternator near the top right, the water pump is about 30cm lower than this, from the alternator look to the bottom of the engine, then look left and you will see the water pump. Now to the lower right of the water pump assembly you will see a metal water pipe with a temperature sensor mounted on top, this is the thermostat cover water inlet. First remove the circular clamp holding the water hose to the water inlet, get a bucket ready underneath this then remove the hose by twisting it up and down gently until it comes away from the metal pipe, hold this hose downwards towards the bottom of the car and drain all the water out. After this you can remove the water inlet, 3 bolts secure this in place, one at the top, one at the bottom and one on the left side in the middle. When you remove the water inlet cover, the thermostat will either come out with it, or remain sitting inside the engine, get a flat head screwdriver and place this into the gap at the top of the thermostat and very gently lever it out. Following this, take the water inlet and in the section where the thermostat sits, use a wire brush to gently remove any rust or contamination which has built up, following this you can install the new round rubber seal that came with your thermostat. Now lightly brush the front of the water pump around where the water inlet will bolt back on. After this you can install the new thermostat and reinstall the water inlet to the water pump assembly.

Once you have done that, install new top and bottom radiator hoses ensure they are properly fitted, the hose should be placed over the metal pipes as far as possible and tighten them using your new round hose clamps make sure the clamps are clamping the hose to the metal pipes and not sitting on the edge or missing the metal pipes, these need to be tightly fastened. Now you will be able to fill the radiator with new coolant and once full run the engine while the radiator cap is STILL REMOVED. Stand at the front of the car with more coolant ready, as the engine runs it will heat up until it eventually reaches operating temperature 82c, following this the thermostat opens and releases the contents of the radiator into the engine, this will cause a sudden and rapid depletion of coolant from the radiator. At this point you are dealing with hot water from the cooling system, so take care not to be burnt. You now need to begin filling the radiator with more coolant straight away until it is once again full, keep watching the water levels, if the level goes down again, top it up once again. Once the water level has remained stable for 10 minutes the system should now be completely full with water and free from major air pockets. Fit the radiator cap again tightly and also fill the plastic coolant reservoir to the specified high level with coolant. Following this, place the coolant bottle in the car and go for a drive around the block a few times, if the water temperature gauge remains at or below half way for 10 minutes of driving you should now have successfully replaced the thermostat and returned your cooling system to a working operational state. Pop the hood bonnet of the car and top up the coolant reservoir once again, also visually check there is no leakage from the radiator cap. Now you can place your head under the front bumper and look for any water dripping out, if there appears to be a leak this is most likely from one of the rubber hoses.

If you could not turn the engine off as mentioned earlier, you now have no choice in this matter and must turn the engine off, as you can not repair the hoses while the engine is running. Let the car sit for around 30 minutes then drive the car home You should be absolutely no more than 10 minutes from home at all times until you are sure the coolant system is fully operational. Once home let the car cool for 2 hours then go about checking your fittings and correcting the problems you had earlier. For these reasons and to save yourself from engine damage, never take short cuts, always ensure the water inlet, water pipes and radiator cap are fitted and tightened securely at the time of fitting, doing this will ensure you do not end up with a leak and risk the possibility of engine damage.
